

# Poverty

A summary of the scientific literature on reducing child poverty.

## **How This Impacts Children's Development**

The impacts of poverty on children oftentimes persist into adulthood. Children living in poverty have the worst health, lower language and cognitive skills, and lower achievement during school years. As they

approach adulthood, they complete less schooling, secure lower-skilled jobs, and are more likely to exhibit criminal behavior.

### **Talking Points from the SRCD Briefs**

- In 2019, about one-eighth of all children in the U.S., or over 9 million, lived in poverty. Poverty rates were more than twice as high for Black (20%) and Hispanic (20%) children compared to White (7%) and Asian (10%) children.
- COVID-era legislation such as the Coronavirus Aid, Relief, and Economic Security Act (CARES Act) and the expanded Child Tax Credit kept child poverty levels lower than what they would have been without intervention during the national crisis.
- A growing body of evidence shows that cash or near-cash benefits can improve children's development and boost economic productivity in adulthood. For example, women who received Supplemental Nutrition Assistance Program (SNAP) benefits in the 1960s and 1970s were less likely to have low birth weight babies. Increases in the federal Earned Income Tax Credit (EITC) for low-wage workers with children led to improvements in birth weight, school achievement, high school graduation rates, and college attendance. Additionally, in North Carolina, distributing casino revenues to some rural families was linked to reduced youth psychiatric disorders, drug abuse, and crime, as well as higher high school graduation rates.
- Chronic stress from living in poverty can negatively impact children's responses to everyday challenges in schools and communities. Since the mid-1990s, U.S. antipoverty policy has shifted from providing cash assistance through the welfare system to increasing cash assistance through the tax system.
- Programs that work to improve children's development through high-quality early care and education show positive effects, although oftentimes only in the short term.

### **Policy Considerations in the Briefs**

1. If policymakers combine the existing federal income support policies that have shown to reduce child poverty with an expansion of the Child Tax Credit from the American Rescue Plan Act of 2021, they could cut child poverty in half, moving 4.5 million children out of poverty.
2. The National Academies of Sciences found that an effective policy to reduce child poverty was to replace the pre-pandemic Child Tax Credit with an annual \$3,000 per-child allowance, distributed in monthly installments, which was estimated to reduce child poverty by 40%.
3. Conditional Cash Transfer (CCT) programs are an approach that has shown success in improving human capital outcomes and reducing poverty.
  - Examples in the US include Temporary Assistance to Needy Children (TANF) and programs that provide forms of in-kind assistance that offset some of the need for cash (such as housing subsidies).
